DETAILED ACTION

Allowable Subject Matter

1. Claims **1-20** are allowed.
2. The following is an examiner's statement of reasons for allowance:

Regarding claims 1, 11, and 16, the prior art fails to teach or fairly suggest a device for managing packets in a data stream, comprising: a write request control unit to divide packets into long cells and short cells; and an access control unit to store pointers to long cells in a plurality of long cell queues and pointers to the short cells in a plurality of short cell queues during a write cycle, where the write request control unit selectively pairs a long cell from any one of the long cell queues with a short cell from any one of the short cell queues.

Regarding claim 3, the prior art fails to teach or fairly suggest a device for managing packets in a data stream, comprising: a write request control unit to divide packets into long cells and short cells; an access control unit which stores the optimized long and short cell pair determined by the write request control unit, where the access control unit suspends the optimized performance order whenever a difference in the write index of top long and short cell pointers exceeds a predetermined threshold.

Regarding claims 6, the prior art fails to teach or fairly suggest a device for managing packets in a data stream, comprising: a write request control unit to divide packets into long cells and short cells; access control unit operable to store long cell and short cell pointer pairs; and a request control unit providing transmit requests to the

access control unit, which stores the long request in the long cell queue and the short request in the short cell queue.

Regarding claim 12, the prior art fails to teach or fairly suggest a method for managing packets in a data stream, comprising: dividing packet cells into long and short cells, storing these cells in long and short cell queues, establishing an optimized performance order for the long and short cell queues, where the when the optimized performance order is suspended stale long and short cell pointers are processed.

Regarding claim 13, the prior art fails to teach or fairly suggest packet management method of dividing packets into long and short cells, pairing a long cell with a short cell and storing the pointers to these pairs into the long cell queue and the short cell queue, and pairing a long request with a short request and storing the requests in the long cell queue and the short cell queue.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
